HEADLINES

WHITE STORK* Fen Drayton Lakes on the 1st, Eldernell possibly a different bird but carrying a ring so another escape on the 19th and 21st.

CATTLE EGRET* Ouse Washes on the 6th and 26th - 27th.

PURPLE HERON* Ouse Fen an adult on the 20th.

SPOONBILL Needingworth on the 20th, Fen Drayton Lakes 3 on the 30th.

RED-NECKED GREBE* March Farmers on the 14th.

BLACK-NECKED GREBE March Farmers from 14th - 18th.

LITTLE CRAKE* Ouse Fen on the 23rd - heard at night. The third county record.

1. Near Barnwell on March 16th 1826.
 2. Chesterton in late March 1864.
- Both these records were of birds 'collected'

Little Crake was first recorded in 1791 in Sussex. Since then there have been around 100 records, many in East Anglia and on spring and autumn passage. Spring birds March-May.

HONEY BUZZARD* Wicken Fen a flyover on the 14th, New Shardlows Farm on the 25th.

BLACK KITE* Bar Hill GC a flyover on the 11th, Cambridge a flyover on the 20th

BLACK-WINGED STILT Eldernell on the 3rd - 4th then 7th - 8th, and again on 23rd - 26th, Ferry Meadows CP on the 18th. This bird seems to have wandered around having been also seen at Frampton Marsh in Lincolnshire and at Rutland Water. The identification was made by the same missing wing feather in all cases.

Other records

All records below refer to the month at the head of the E-bulletin and where no numbers are given the record relates to single birds.

Where there is an asterisk after the name of the species this indicates that it is necessary to send a description to the County Recorder before the record will be accepted.

Weather: a fine start to the month led to a record temperature over the Bank Holiday weekend and dry weather in the first ten days saw water levels fall on wetland sites. A day of heavy rain was followed by warm sunshine for much of the middle of the month until the end when a mixture of occasional days of rain with one or two thundery downpours in certain places were balanced by some warm sunshine.

A comment on migration: throughout the systematic list the main passage migrants, waders and terns, show a similar pattern with passage in two distinct phases. The first during the early days of the month, notably the 6th and 7th; after which northerly winds held up migrants until the second phase began on the 21st and continued until the end of the month.

Our cold wet winter should have had little bearing on arrivals from the south but clearly sub-Saharan summer migrants have also arrived untypically late with many observers reporting the lack of hirundines and Swifts and at some wetland sites Reed and Sedge Warblers.

There are no indoor meetings during the summer. The next meeting is in September.

News and Comment:

Late arrivals or not at all

Many observers have commented on particular arrival related events (or non-events) this spring, a poor wader passage being one, shortage of Sedge Warblers being another and the late arrival of Swifts and Spotted Flycatchers. On the Brecks the Stone Curlews appear to be having a poor year.

Egg collecting

The nineteenth century craze for egg collecting seems not to have died out entirely in the twenty-first century despite being outlawed for some time - does that add to the thrill? Broadland police apprehended a suspicious person and a search of his home revealed a large collection of rare birds eggs. A further incident reported was the raiding of a Stone Curlew's nest on Cavenham Heath a site close to our county. If you think that the concern for confidentiality by the Club's officials is perhaps too draconian then think again. Sadly, these people are still active on our doorstep.

Breeding birds

Don't forget to keep records of breeding birds that fall into the bracket of less common; things like Teal, Pochard, woodpeckers, Kestrels, Sparrowhawks, Buzzards, Oystercatchers etc. Always useful for the Club's database but particularly when, as in the case of Lesser Spotted Woodpecker for instance, a species declines.

Research projects

On the same theme the Club's research focus this year means that it is interested in all records of Grey Wagtail breeding, Sand Martins too. Michael Holdsworth is continuing the project on Spotted Flycatchers (with the BTO) and welcomes all and any reports of breeding pairs. More details of all these projects can be found on the website

James Hanlon's noc mig

For me, a quieter month in Cambourne than in April but the following were of note:

Little grebe (2nd)

The Cambridge High Point Swift Survey

Swift populations nationally are monitored by the Breeding Bird Survey, and BirdTrack also gives an indication of what is happening to Swifts over larger regions. The idea of this survey is to see whether there is an efficient way of monitoring population trends at a more local level.

It is also an objective to engage students and staff of Cambridge University in an environmental project, timed to suit the students, taking a small amount of effort and repeatable every year.

We have chosen 5 high points (4 multi-storey car parks and the Castle Mound) to estimate the abundance of Swifts in a sample of Cambridge airspace.

Multiple scans with binoculars of up to 180° will be performed from each of 9 vantage points, counting the Swifts encountered against the sky in each scan.

The students will doubtless have challenges recognising Swifts, using binoculars - even having binoculars, so I am hoping for help.

If anybody has any spare time and/or spare binoculars between 12:00 and 14:00 on Monday 11th and/or Thursday 14th June - please get in touch.

There will be briefing presentations in the Manatee room at the David Attenborough Building at 12:00 on both Monday and Thursday.

If on any other day this week or the next 2 weeks you feel inclined to perform such a survey yourself, then please get in touch for briefing info. It would take less than an hour of your time.

Thanks

Dick Newell
